GROUP 2 | Shipping Cost Calculator

Read the client conversation as a team. The client is describing their business, not giving you a finished requirements list.

Client conversation

Speaking: Shipping counter supervisor

“We need a simple way for our counter staff to quote shipping prices. Right now people keep reaching for calculators, and we get inconsistent answers. Customers tell us how far the package is going, how much it weighs, and whether they want regular or express delivery.”

“For regular delivery, the charge starts at five dollars, and we add twenty-five cents for each mile. Express costs more: it starts at ten dollars, then we add forty cents for each mile. Customers should only pay for the delivery type they choose.”

“If a package weighs more than twenty pounds, there's also a five-dollar heavy-package charge. That's on top of either delivery rate. At the end, the clerk just needs to see the final shipping price.”

“We sometimes get customers with very short trips, and the staff occasionally types in the wrong numbers. I'd like the software to handle those situations sensibly.”

Your assignment: Extract the rules, list inputs and outputs, identify questions for the client, and draw a flowchart showing the full process. Test at least three cases. No coding required.

You may ask your instructor questions as though they are the client. Do not assume a missing rule without discussing it.

GROUP 2 | WORKSPACE

1 What does the client want the software to do?

2 Business rules you identified

3 Inputs and outputs

4 Questions to ask the client

5 Draw your flowchart on a separate sheet or in a diagramming tool. Include every decision path and outcome.

6 Test three examples: a normal case, a different outcome, and a boundary or unusual case. Write the inputs and expected results below.

TEST	INPUTS / CONDITIONS	EXPECTED RESULT
Normal		
Different outcome		
Boundary / unusual
